Belarus Has Shut Down the Internet Amid a Controversial Election

Human rights organizations have blamed the Belarusian government for widespread outages.

<https://www.wired.com/story/belarus-internet-outage-election/>

Earlier this morning, the national fiber backbone of Iraq was taken offline in an effort to combat cheating on 6th grade placement exams. It was the fourth such outage in the past five days. 2017 marks the third year Iraq has used government-directed internet blackouts to combat cheating on student exams.

These recent outages are a continuation of a growing (and somewhat puzzling) trend by governments in many developing parts of the world to cut communications services in a desperate attempt to staunch rampant cheating on high-stakes student exams.

By MATT KAMEN

Tuesday 3 January 2017

Some Internet communications
are interfered against or heavily congested

Can ISPs selectively slow down traffic?

The U.S. Federal Communications Commission (FCC) set network neutrality rules in 2015

A screenshot of a web browser displaying the New York Times article "F.C.C. Sets Net Neutrality Rules" from March 12, 2015. The browser's address bar shows the URL: <https://www.nytimes.com/2015/03/13/technology/fcc-releases-net-neutrality-rules.html>. The page features a navigation bar with "SECTIONS", "HOME", and "SEARCH" options, along with "SUBSCRIBE NOW" and "LOG IN" buttons. Below the navigation bar, there are several featured articles, including "Snap Aims for Valuation of More Than \$20 Billion in I.P.O.", "Facebook's Zuckerberg, Bucking Tide, Takes Public Stand Against Isolationism", "Tech We're Using: Why I Still Love TiVo and How a Sous Vide Gadget Rescued Me", "Airlines Phasing Out Screens Because You Are All on Your Devices", "Social Q's: Family Planning ... for Your Phones", and "Tech Tip: Adding Facebook's Birthday List to a Calendar Program".

The main article, "F.C.C. Sets Net Neutrality Rules", is by Rebecca R. Ruiz and dated March 12, 2015. It includes a video player with the title "The New Net Neutrality Rules" by Natalia V. Osipova and Caitlin Prentke. The video player shows a hand clicking a computer mouse. Below the video player, there is a caption: "The Federal Communications Commission is to take a more active role in regulating the Internet as a public utility, which is expected to provoke court cases from major broadband providers. By NATALIA V. OSIPOVA and CAITLIN PRENTKE on March 12, 2015. Photo by The New York Times. Watch in Times Video".

To the right of the video player, there is a "RELATED COVERAGE" section with two items: "F.C.C. Approves Net Neutrality Rules, Classifying Broadband Internet Service as a Utility" by Feb. 26, 2015, and "News Analysis: The Push for Net Neutrality Arose From Lack of Choice" by Feb. 25, 2015.

The article text begins with: "WASHINGTON — The [Federal Communications Commission](#) on Thursday released extensive details of how it would regulate broadband Internet providers as a public utility, producing official wording that almost certainly sets the stage for extended legal fights. The release of the rules had been eagerly anticipated by advocates and lawmakers, as well as broadband and technology companies, since the agency approved new rules for Internet service [two weeks ago](#). The details came in a [313-page document](#) that included the new rules and the legal justifications for them. The rules revealed how the strict laws would be modified for Internet providers, exempting the companies from the sort of price controls typically

<http://nyti.ms/2kZUnDA>

... which it then repealed in 2017

The screenshot shows a web browser displaying a New York Times article. The browser's address bar shows the URL: <https://www.nytimes.com/2017/12/14/technology/net-neutrality-repeal-vote.html>. The page header includes the New York Times logo, navigation links (Sections, Home, Search), and buttons for 'SUBSCRIBE NOW' and 'LOG IN'. The article is categorized under 'TECHNOLOGY' and has the headline 'F.C.C. Repeals Net Neutrality Rules' by Cecilia Kang, dated December 14, 2017. A large photograph shows a television set on a black cloth-covered stand, displaying a man in a suit speaking. To the right of the main image is a 'RELATED COVERAGE' section with five links, each featuring a small thumbnail image and a title. At the bottom of the page, a small text line reads: 'Connecting... Ajit Pai, the F.C.C. chairman, said the rollback of the net neutrality rules would eventually help consumers.'

Net Neutrality Likely To Return With New FCC Chair

Wayne Rash Contributor ⓘ
[Consumer Tech](#)
Wayne Rash is a technology and science writer based in Washington.

<https://www.forbes.com/sites/waynerash/2021/01/26/net-neutrality-likely-to-return-with-new-fcc-chair/>

In Switzerland, network neutrality is enforced by the Swiss Telecommunications Act—since 1/1/21

– Art. 12e⁴¹ Offenes Internet

¹ Die Anbieterinnen von Internetzugängen übertragen Informationen, ohne dabei zwischen Sendern, Empfängern, Inhalten, Diensten, Dienstklassen, Protokollen, Anwendungen, Programmen oder Endgeräten technisch oder wirtschaftlich zu unterscheiden.

² Sie dürfen Informationen unterschiedlich übertragen, wenn dies erforderlich ist, um:

- a. eine gesetzliche Vorschrift oder einen Gerichtsentscheid zu befolgen;
- b. die Integrität oder Sicherheit des Netzes, der über dieses Netz erbrachten Dienste oder der angeschlossenen Endgeräte zu gewährleisten;
- c. einer ausdrücklichen Aufforderung der Kundin oder des Kunden nachzukommen; oder
- d. vorübergehende und aussergewöhnliche Netzwerküberlastungen zu bekämpfen; dabei sind gleiche Arten von Datenverkehr gleich zu behandeln.

³ Sie dürfen neben dem Zugang zum Internet über denselben Anschluss andere Dienste anbieten, die für bestimmte Inhalte, Anwendungen oder Dienste optimiert sein müssen, um die Qualitätsanforderungen der Kundinnen und Kunden zu erfüllen. Die anderen Dienste dürfen nicht als Ersatz für Internetzugangsdienste nutzbar sein oder angeboten werden, und sie dürfen nicht die Qualität der Internetzugangsdienste verschlechtern.

⁴ Behandeln sie Informationen bei der Übertragung technisch oder wirtschaftlich unterschiedlich, so müssen sie die Kundinnen und Kunden sowie die Öffentlichkeit darüber informieren.

⁴¹ Eingefügt durch Ziff. I des BG vom 22. März 2019, in Kraft seit 1. Jan. 2021 (AS 2020 6159; BBl 2017 6559).

The Internet Is Resilient Enough to Withstand Coronavirus – But There's a Catch

By David Belson

Former Senior Director, Internet Research and Analysis

Earlier this year, as COVID-19 began to dominate our lives, the world turned to the Internet. This sudden shift to distance learning, working from home, and families sheltering in place drove up online streaming demand, placing additional load on Internet application platforms like Zoom, Netflix, and educational tools such as Kahoot. There was also a dramatic traffic increase across supporting network providers.

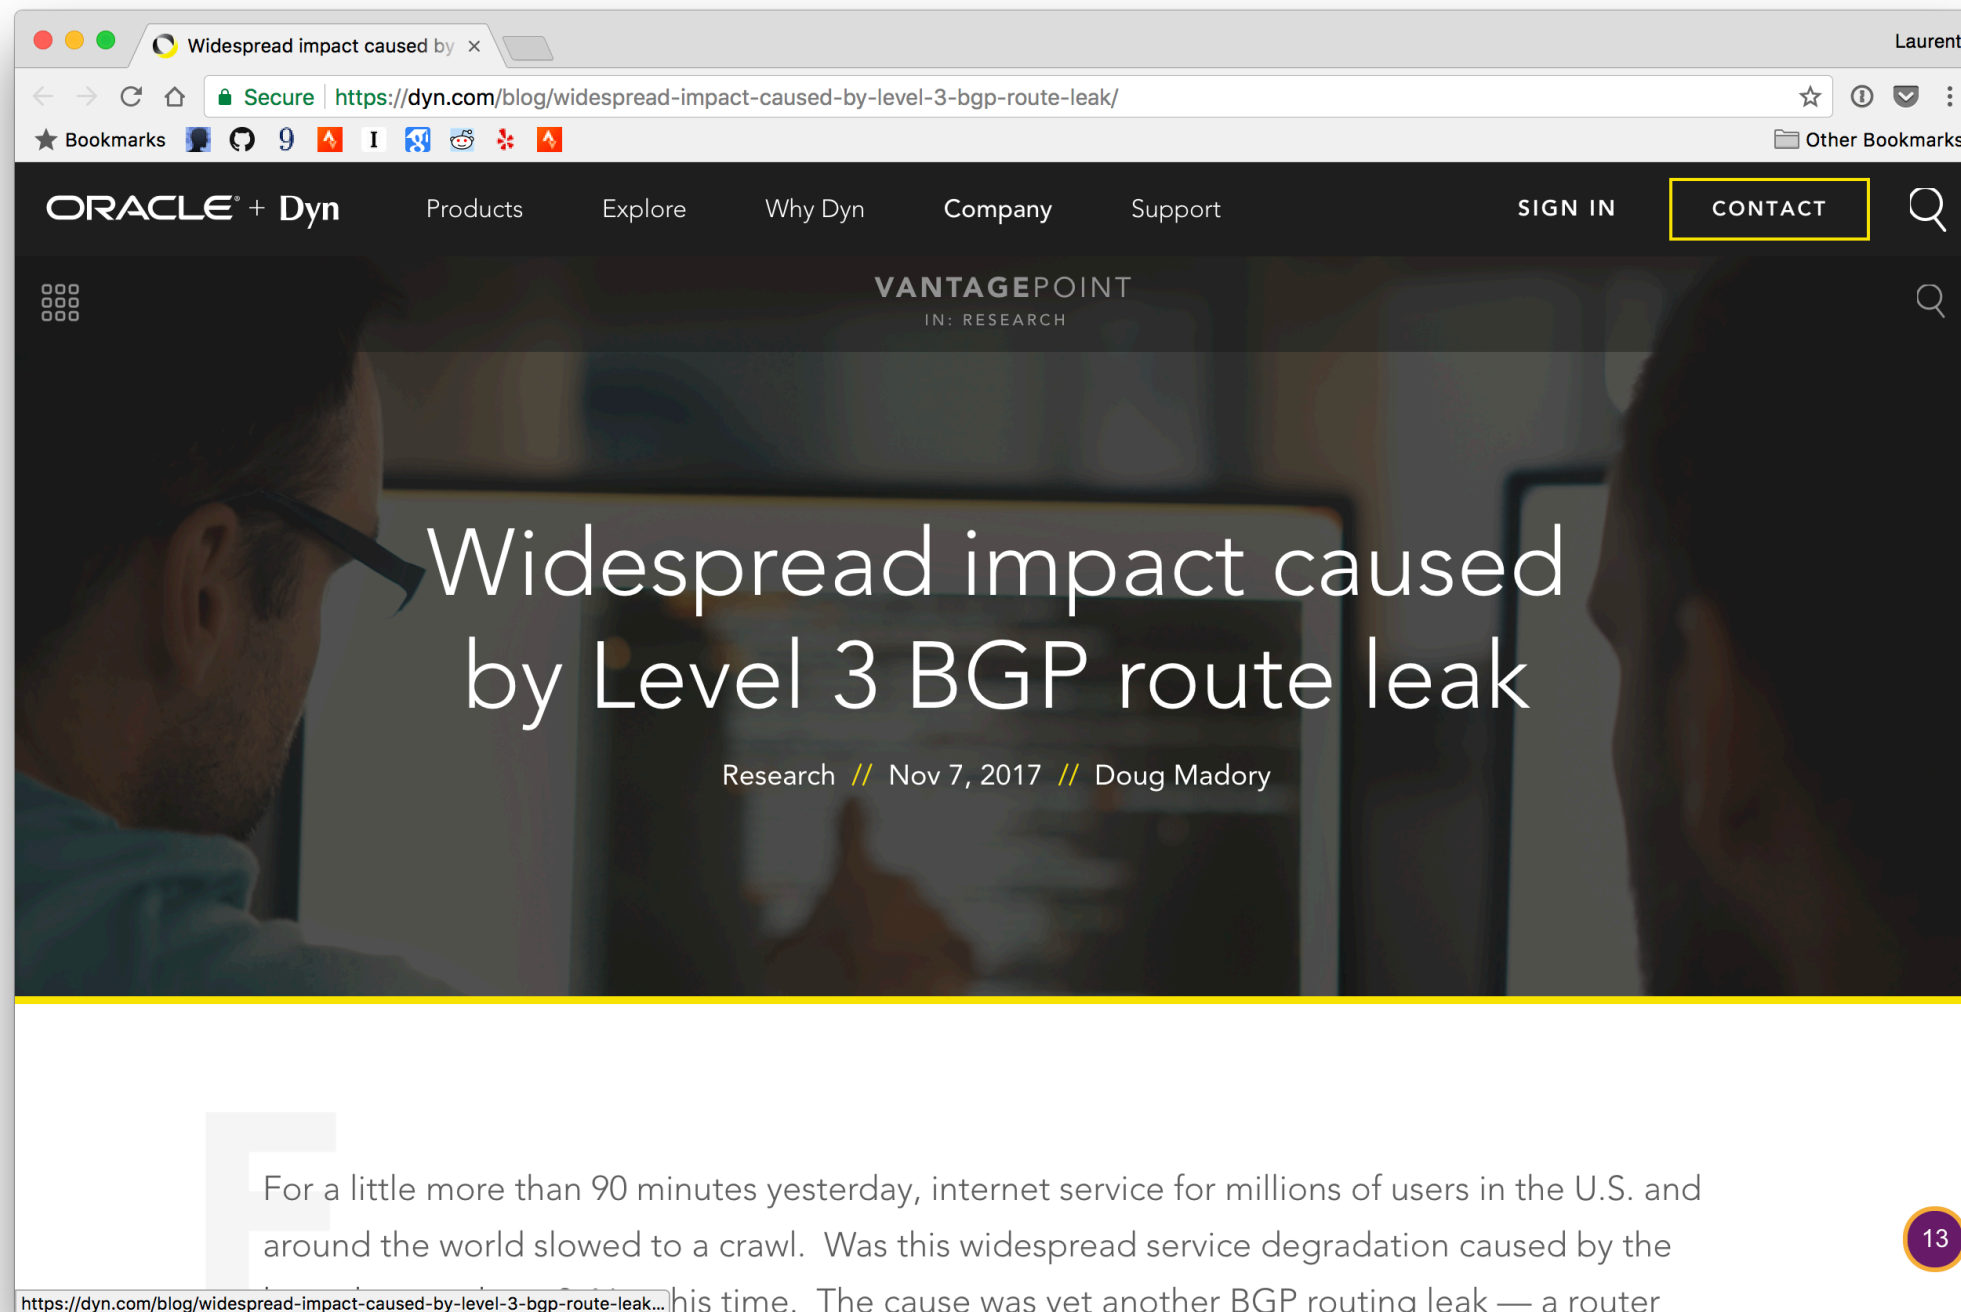

[source]

The Internet

A fragile place

Despite being absolutely critical,
Internet communications are inherently fragile

November 2017

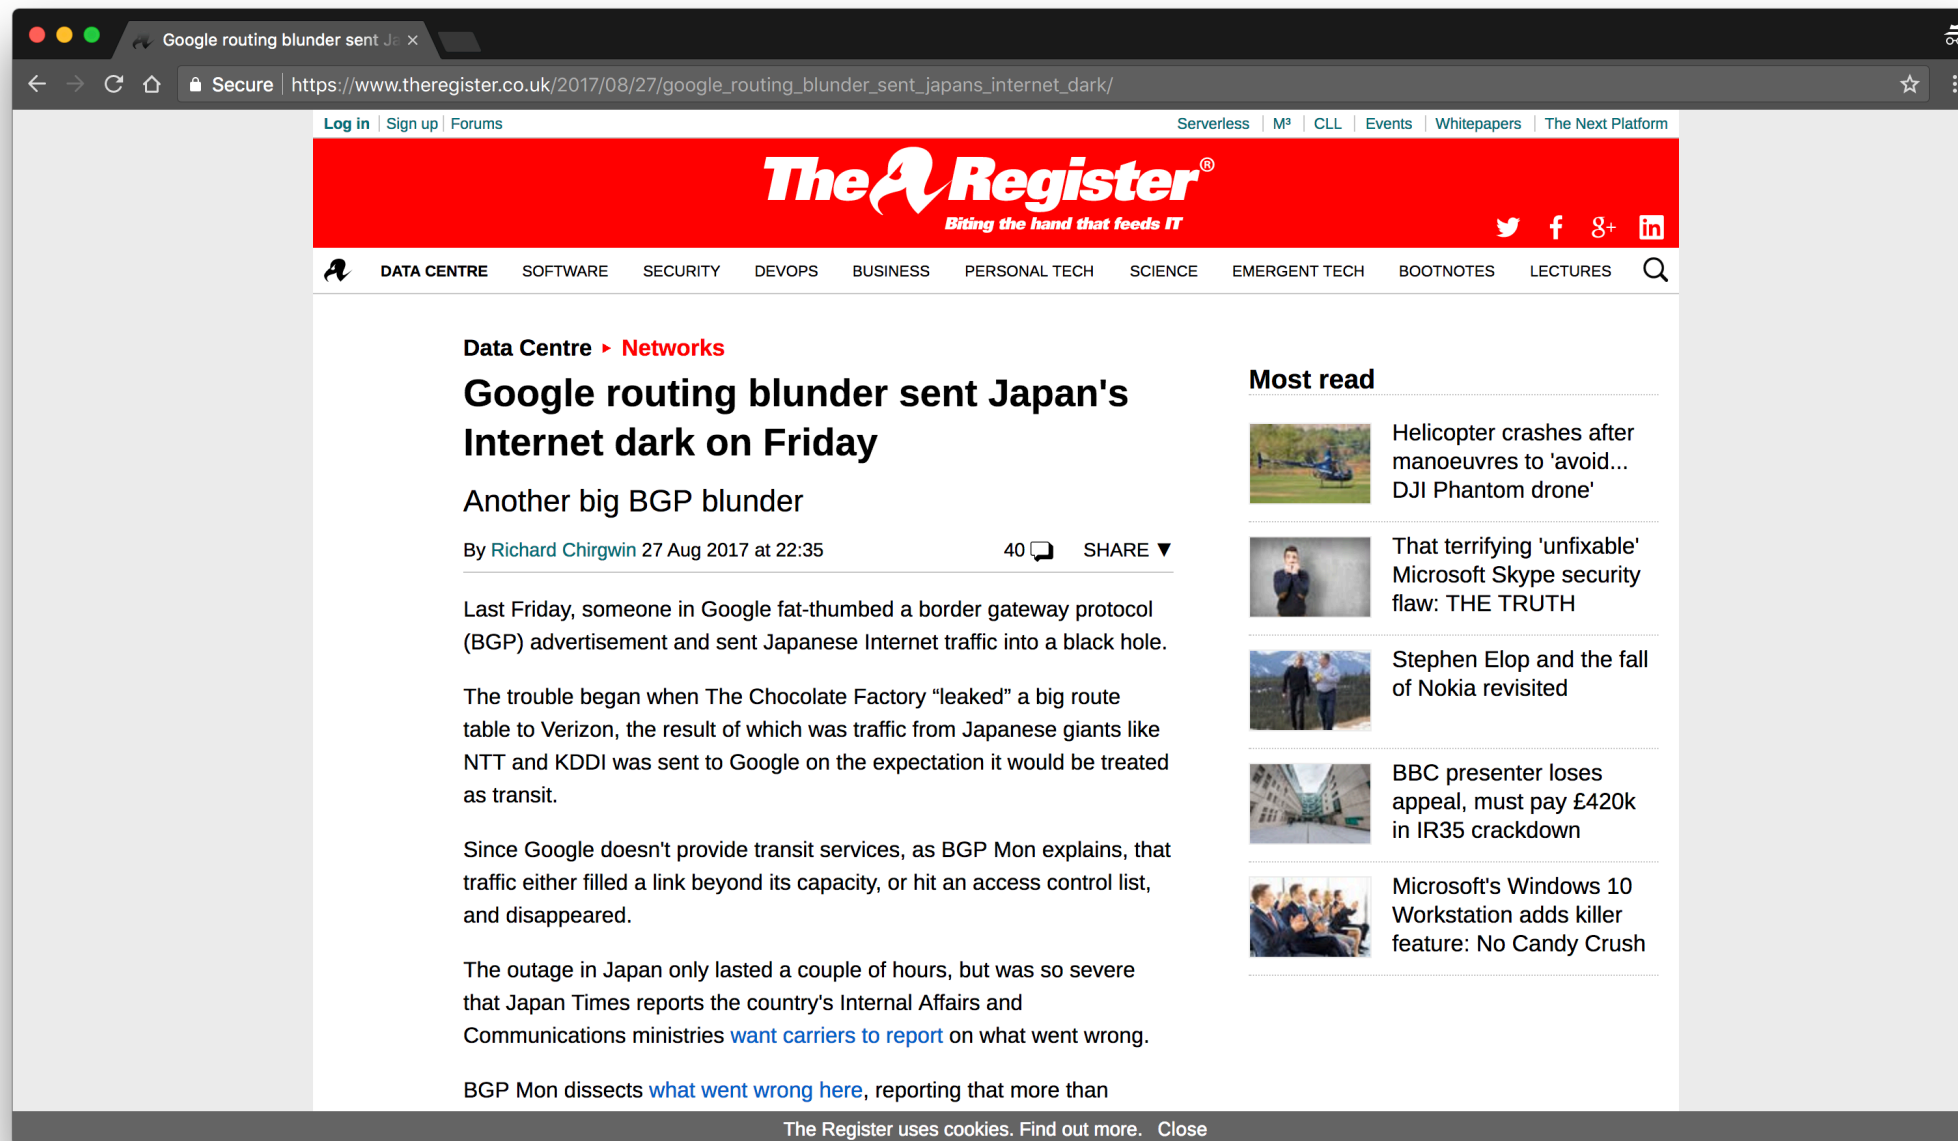

<https://dyn.com/blog/widespread-impact-caused-by-level-3-bgp-route-leak/>

For a little more than 90 minutes [...],

Internet service for millions of users in the U.S.
and around the world slowed to a crawl.

The cause was yet another BGP routing leak,
a **router misconfiguration** directing Internet traffic
from its intended path to somewhere else.

August 2017

https://www.theregister.co.uk/2017/08/27/google_routing_blunder_sent_japans_internet_dark/

Someone in Google fat-thumbbed a
Border Gateway Protocol (BGP) advertisement
and sent Japanese Internet traffic into a black hole.

[...] the result of which was traffic from Japanese giants
like NTT and KDDI was sent to Google
on the expectation it would be treated as transit.

The outage in Japan **only lasted a couple of hours**,
but was so severe that [...] the country's
Internal Affairs and Communications ministries
want carriers to report on what went wrong.

People also often mistakenly destroy
their own infrastructure

Traders work on the floor of the New York Stock Exchange (NYSE) in July 2015.

United Airlines Blames Router for Grounded Flights

**Alexandra Talty**, CONTRIBUTOR*I cover personal finance and travel.*[FOLLOW ON FORBES \(110\)](#)

Opinions expressed by Forbes Contributors are their own.

FULL BIO ▾

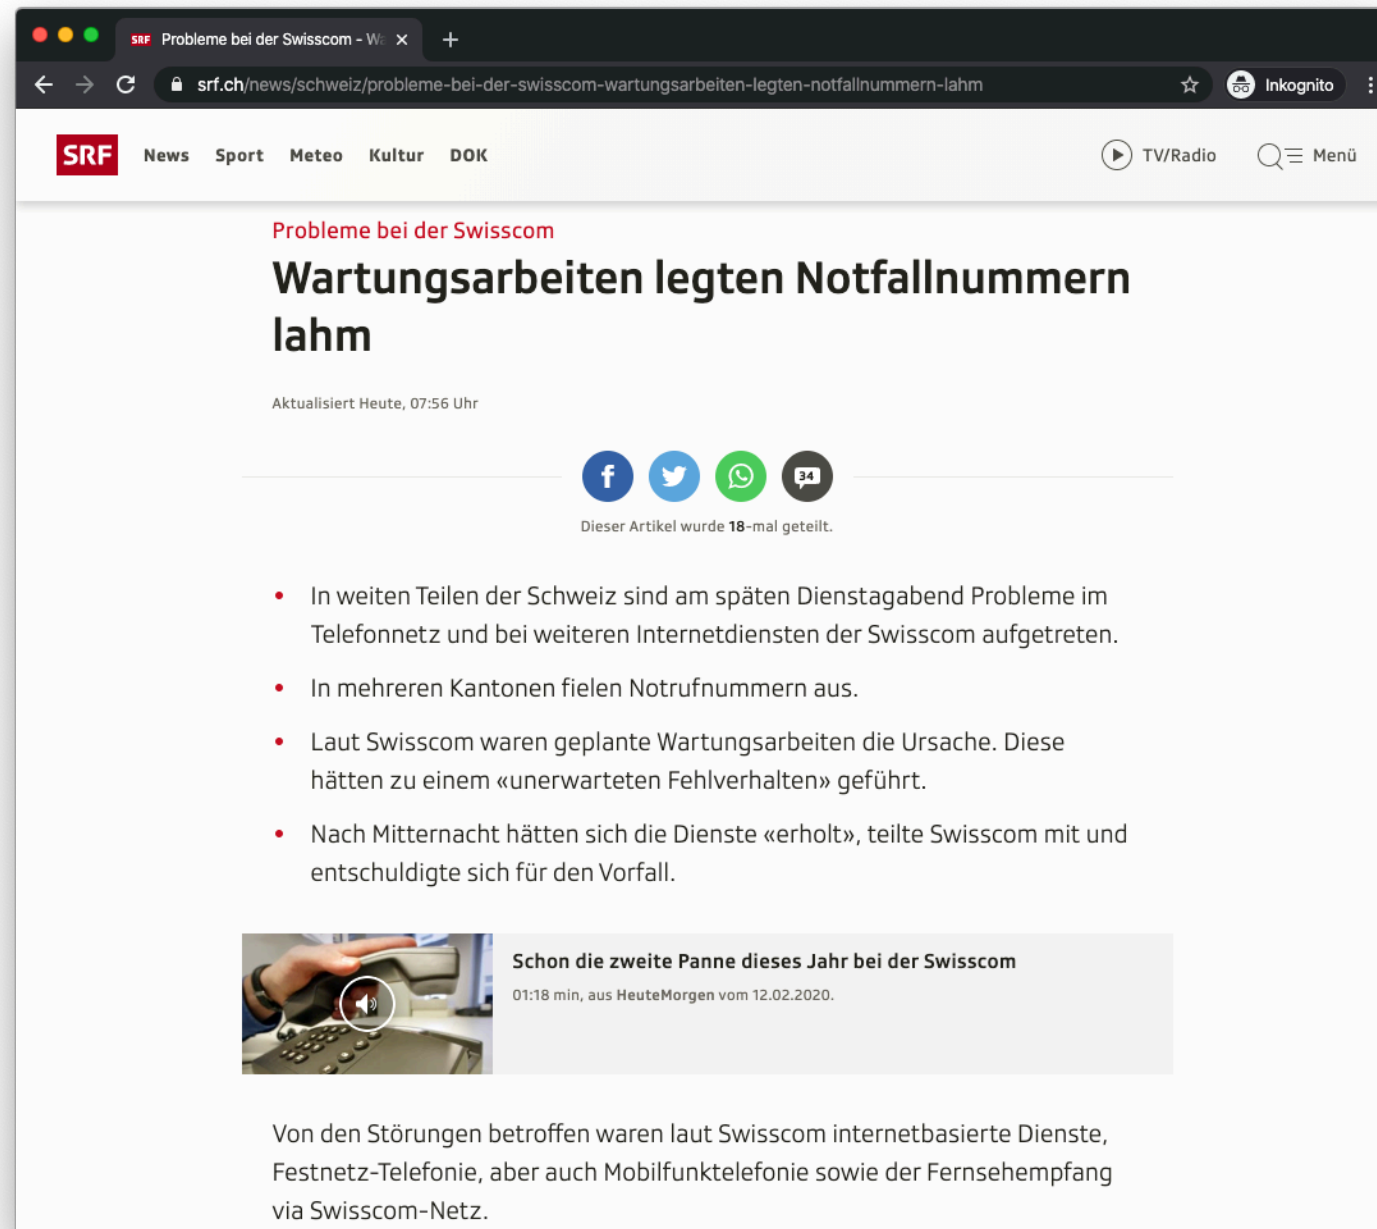

After a computer problem caused nearly two hours of grounded flights for United Airlines this morning and ongoing delays throughout the day, the airline announced the culprit: a [faulty router](#).

Spokeswoman Jennifer Dohm said that the router problem caused “degraded network connectivity,” which affected various applications.

A computer glitch in the airline’s reservations system caused the Federal Aviation Administration to impose a groundstop at 8:26 a.m. E.T. Planes that were in the air continued to operate, but all planes on the ground were held. There were reports of agents writing tickets by hand. The ground stop was lifted around 9:47 a.m. ET.

Somewhere in Manhattan...

<http://www.petergarritano.com/the-internet.html>

There exists a huge amount of **access technologies**

Ethernet	most common, symmetric
DSL	over phone lines, asymmetric
CATV	via cable TV, shared
Cellular	smart phones
Satellite	remote areas
FTTH	household
Fibers	Internet backbone
Infiniband	High performance computing

Communication Networks

Part 1: Overview

What is a network made of?

#2

How is it shared?

How is it organized?

How does communication happen?

How do we characterize it?

3 must-have requirements of a good network topology

Tolerate failures

several paths between each source and destination

Possess enough sharing to be feasible & cost-effective

number of links should not be too high

Provide adequate per-node capacity

number of links should not be too small

Compare these three designs in terms of
sharing, **resiliency**, and **per-node capacity**

design

full-mesh

chain

bus

advantages

disadvantages

Switched networks provide
reasonable and **flexible** compromise

design

switched

advantages

sharing and per-node capacity can be adapted
to fit the network needs

disadvantages

require smart devices to perform:
forwarding, routing, **resource allocation**

Links and switches are shared between flows

There exist two approaches to sharing:
reservation and **on-demand**

Reservation

On-demand

principle

reserve the bandwidth
you need in advance

send data when you need

Both are examples of **statistical multiplexing**

Reservation

On-demand

multiplexing

at the flow-level

at the packet-level

Between reservation and on-demand:
Which one do you pick?

Consider that each source
needs 10 Mbps

What do they get with:

- reservation
- on-demand

Assume the following peak demand and flow duration

Assume the following peak demand and flow duration

What does each source get with **reservation** and on-demand?

- first-come first-served
- equal (10 Mbps)

Peak vs average rates

Each flow has	Peak rate	P
	Average rate	A

Reservation must reserve P , but level of utilization is A/P

$P=100$ Mbps, $A=10$ Mbps, level of utilization=10%

On-demand can usually achieve higher level of utilization
depends on degree of sharing and burstiness of flows

Ultimately, it depends on the application

Reservation **makes sense** when **P/A is small**

voice traffic has a ratio of 3 or so

Reservation **wastes capacity** when **P/A is big**

data applications are bursty, ratios >100 are common

Reservation **makes sense** when P/A is small

voice traffic has a ratio of 3 or so

Reservation **wastes capacity** when P/A is big

data applications are bursty, ratios >100 are common

That's why the phone network used reservations

... and why the Internet does not!

The two approaches are implemented using circuit-switching or packet-switching, respectively

Reservation

On-demand

implem.

circuit-switching

packet-switching

Reservation

On-demand

implem.

circuit-switching

packet-switching

Circuit switching relies on
the Resource Reservation Protocol

- (1) **src** sends a reservation request for 10Mbps to **dst**
- (2) switches “establish a circuit”
- (3) **src** starts sending data
- (4) **src** sends a “teardown circuit” message

There exist many kinds of circuits

Time-based multiplexing

- divide time in slots
- allocate one slot per circuit

Frequency-based multiplexing

- divide spectrum in frequency bands
- allocate one band per circuit

Let's walk through example of data transfer using circuit switching

The efficiency of the transfer depends on how utilized the circuit is once established

This is an example of poor efficiency.

The circuit is mostly idle due to traffic bursts

This is another example of poor efficiency.
The circuit is used for a short amount of time

Another problem of circuit switching is that it doesn't route around trouble

A is forced to signal a new circuit to restore communication

Pros and cons of circuit switching

advantages

predictable performance

simple & fast switching
once circuit established

disadvantages

inefficient if traffic is bursty or short

complex circuit setup/teardown
which adds delays to transfer

requires new circuit upon failure

What about packet switching?

Reservation

circuit-switching

On-demand

packet-switching

In packet switching,
data transfer is done using independent packets

Each packet contains a destination (**dst**)

Since packets are sent without global coordination,
they can “clash” with each other

To absorb transient overload,
packet switching relies on buffers

To absorb transient overload,
packet switching relies on buffers

Packet switching routes around trouble

route recomputed
on the fly by s2

Pros and cons of packet switching

advantages

efficient use of resources

simpler to implement

route around trouble

disadvantages

unpredictable performance

requires buffer management and
congestion control

Packet switching beats circuit switching
with respect to *resiliency* and *efficiency*

Internet  packets

Packet switching will be our focus for the rest of the course

Communication Networks

Part 1: Overview

What is a network made of?

How is it shared?

#3 **How is it organized?**

How does communication happen?

How do we characterize it?

The *Inter*net is a network of networks

Internet Service Providers

So far, this is our vision of the Internet...

The real Internet is a “tad” more complex

<http://www.opte.org>

The Internet has a hierarchical structure

Tier-1

international

have no provider

Tier-2

national

provide transit to Tier-3s

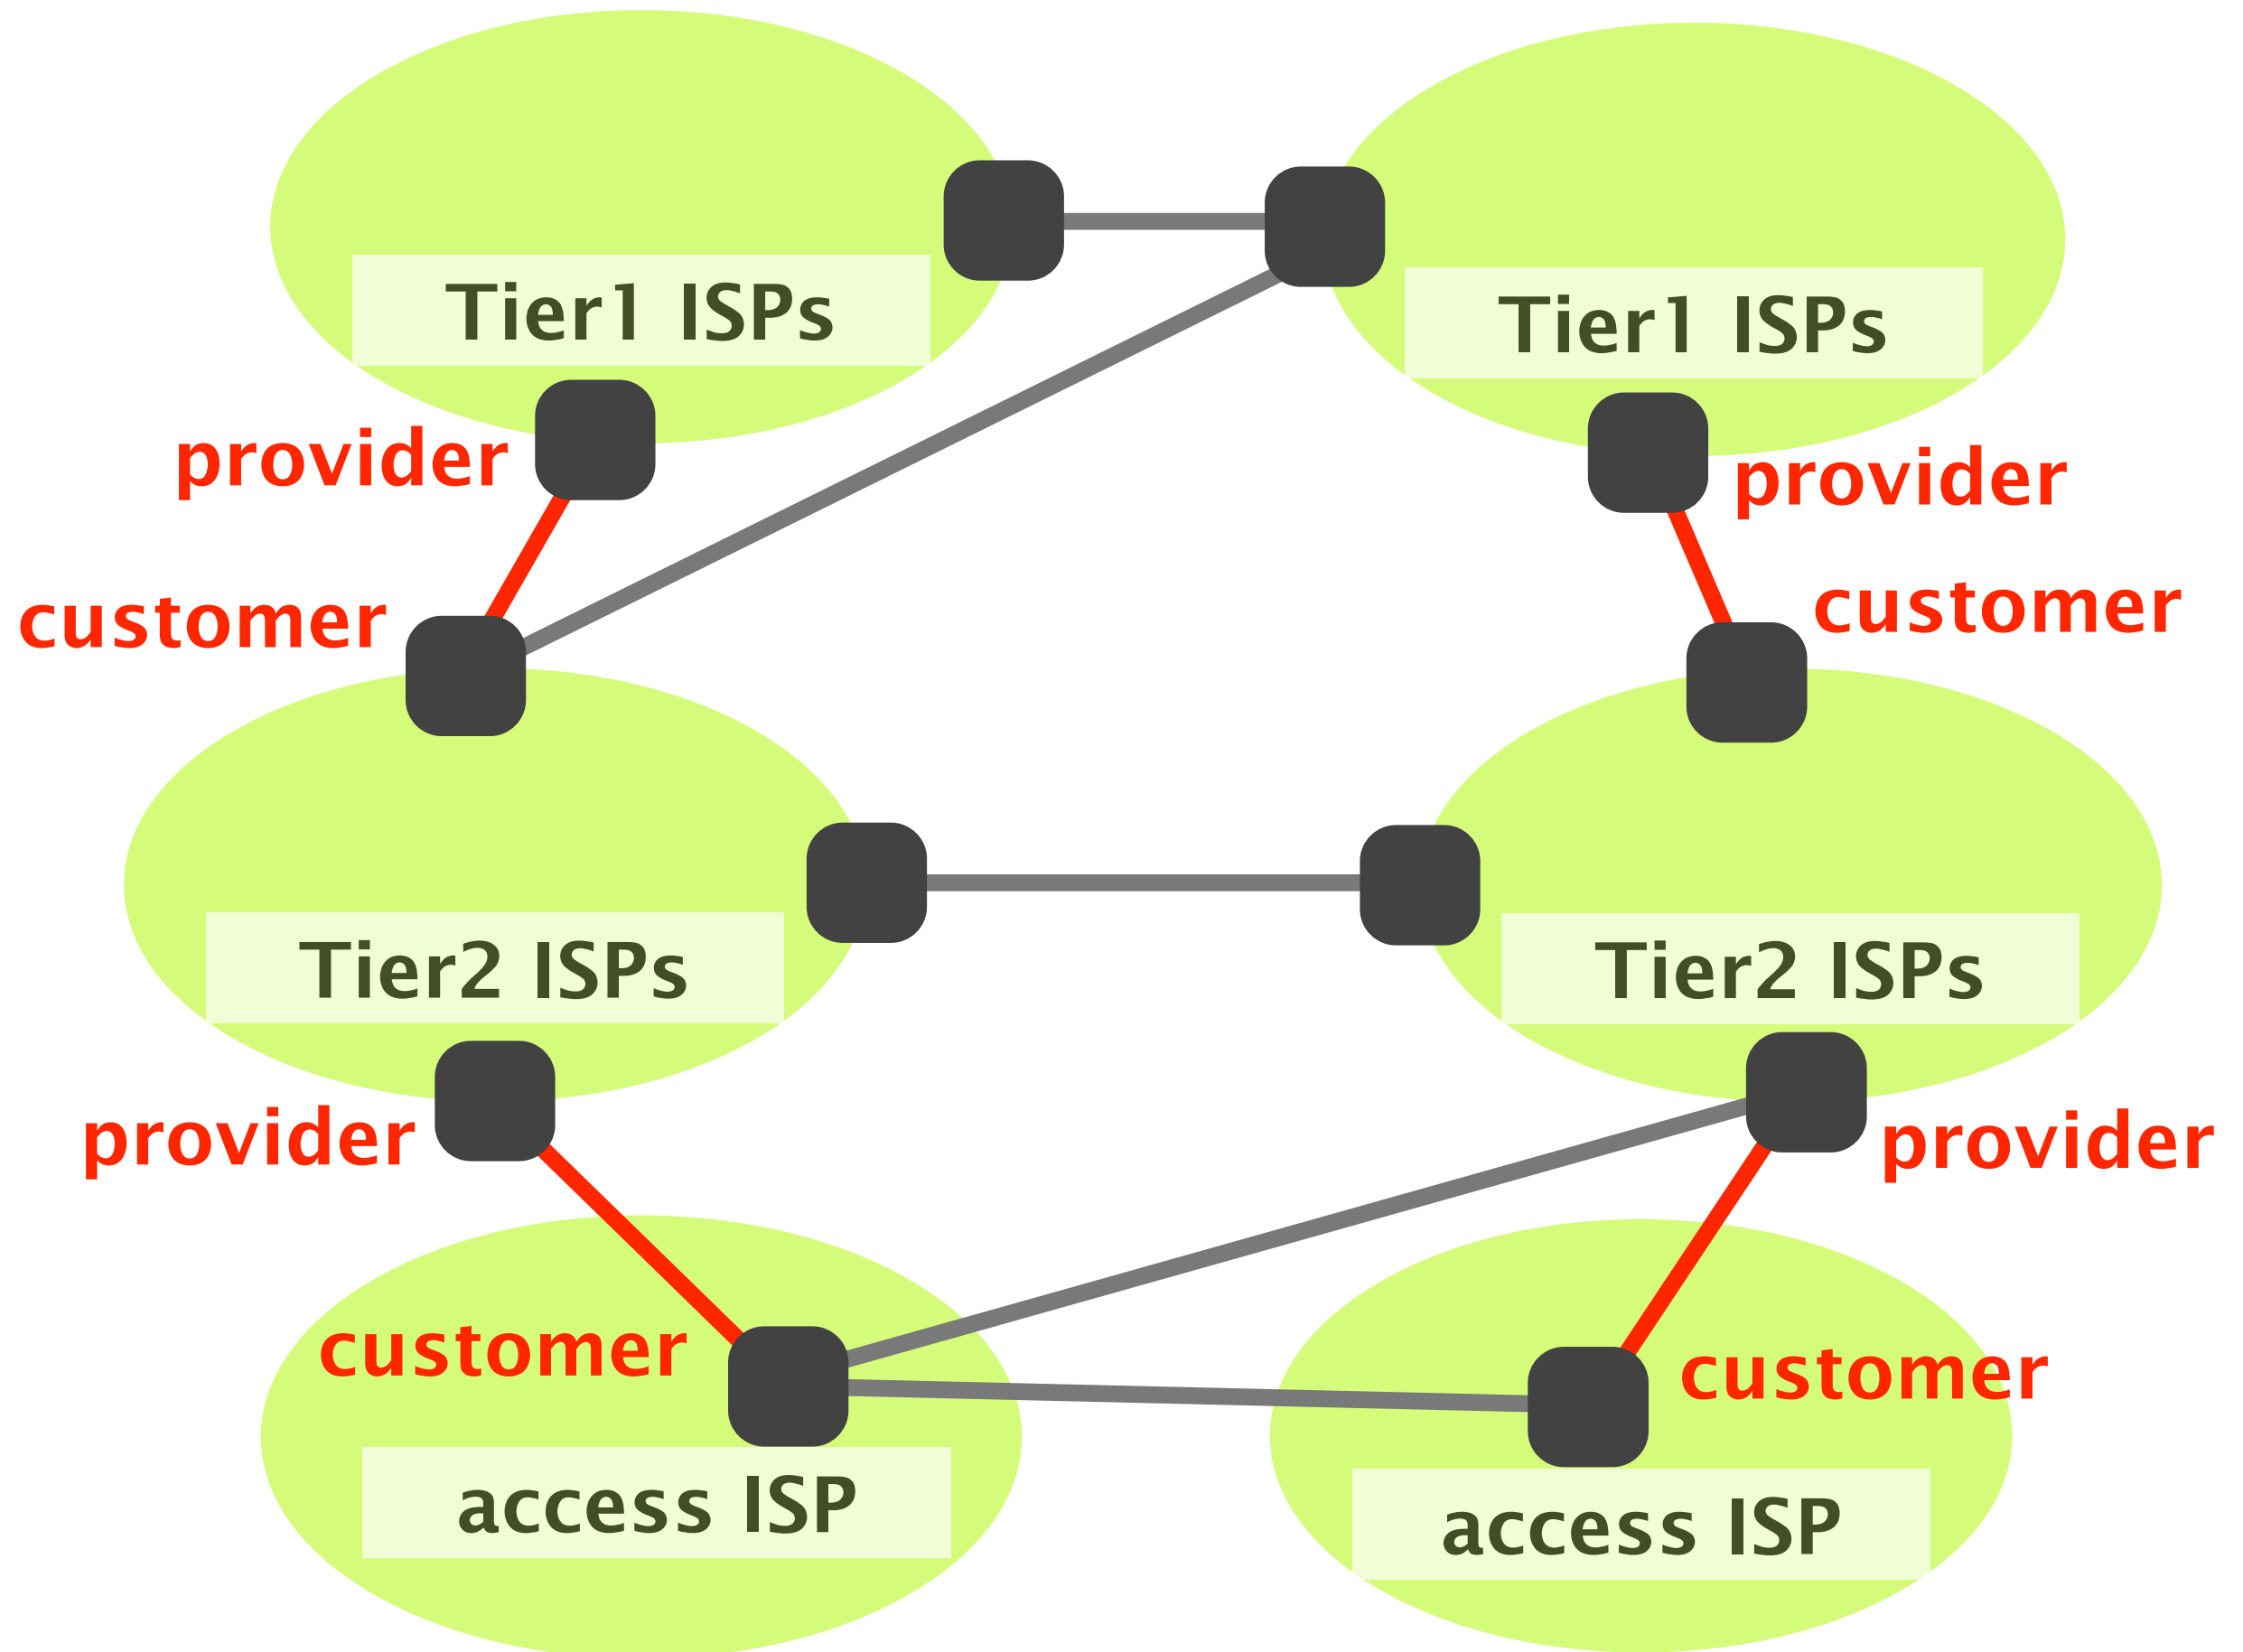

have at least one provider

Tier-3

local

do not provide any transit

have at least one provider

The distribution of networks in Tiers is extremely skewed towards Tier-3s

total ~70,000
networks

Tier-1
international

have no provider

~12

Tier-2
national

provide transit to Tier-3s
have at least one provider

~1,000s

Tier-3
local

do not provide any transit
have at least one provider

85-90%

Some networks have an incentive to connect directly,
to reduce their bill with their own provider

This is known as “peering”

Interconnecting each network to its neighbors one-by-one is not cost effective

Physical costs

of provisioning or renting physical links

Bandwidth costs

a lot of links are not necessarily fully utilized

Human costs

to manage each connection individually

Internet eXchange Points (IXPs) solve these problems by letting *many* networks connect in one location

A brief overview of Internet history

The Internet history starts in the late 50's,
with people willing to communicate differently

Telephone network is *the* communication system
entirely based on circuit switching

People start to want to use networks for other things
defense, (not personal) computers, ...

... but knew that circuit-switching will not make it
too inefficient for bursty loads and not resilient

From this wish arose three crucial questions

Paul Baran

RAND

How can we design a **more resilient** network?

lead to the invention of packet switching

Len Kleinrock

UCLA

How can we design a **more efficient** network?

(also) lead to the invention of packet switching

Bob Kahn

DARPA

How can we **connect** all these networks together?

lead to the invention of the Internet as we know it

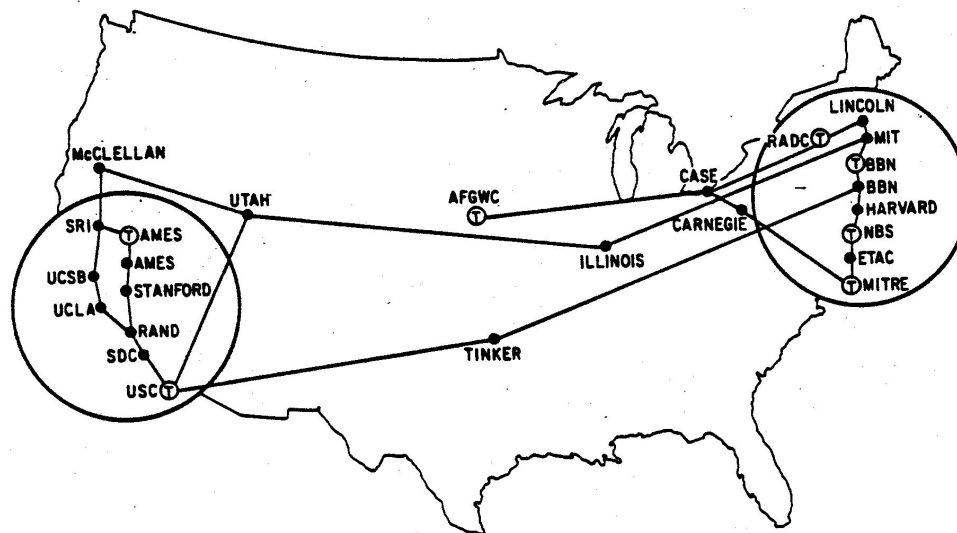

The 60s saw the creation of packet switching and the **A**dvanced **R**esearch **P**rojects **A**gency **N**etwork

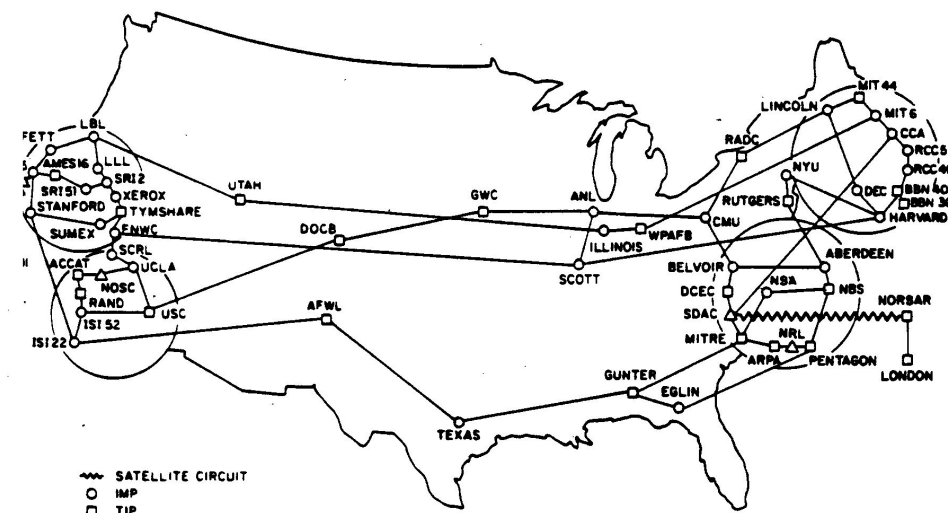

Dezember 1969

Juni 1970

März 1972

Juli 1977

The first message ever exchanged on the Internet was “lo”

Oct. 29 1969

Leonard Kleinrock @UCLA tries
to log in a Stanford computer

UCLA

We typed the L... Do you see it?

Yes! We see the L Stanford

We typed the O... Do you see it?

Yes! We see the O

We typed the G. **system crashes**

The 70s saw the creation of Ethernet, TCP/IP and the e-mail

1971	Network Control Program predecessor of TCP/IP
1972	Email & Telnet
1973	Ethernet
1974	TCP/IP paper by Vint Cerf & Bob Kahn

In the 80s, TCP/IP went mainstream

1983	NCP to TCP/IP Flag day Domain Name Service (DNS)
1985	NSFNet (TCP/IP) succeeds to ARPANET
198x	Internet meltdowns due to congestion
1986	Van Jacobson saves the Internet (with congestion control)

The 90s saw the creation of the Web as well as the Internet going commercial

1989

Arpanet is decommissioned

Birth of the Web

Tim Berners Lee (CERN)

Swiss made

1993

Search engines invented (Excite)

1995

NSFNet is decommissioned

1998

Google reinvents search

The new millennium brings the Web 2.0, focus on user-generated content

1998	IPv6 standardization
2004	Facebook goes online
2006	Google buys YouTube
2007	Netflix starts to stream videos
2007	First iPhone Mobile Internet access

Fast Internet access everywhere, every device needs an Internet connection

2009

2018

Mining of the Bitcoin genesis block

Fast mobile Internet access: 4G/LTE

Internet of Things (IoT) boom

Cars & refrigerators in the Internet

Only 26% of the Alexa Top 1000
websites reachable over IPv6

<http://www.worldipv6launch.org/measurements/>

Soon?

Fully encrypted transport protocols

For example QUIC

Communication Networks

Part 1: Overview

- #1 What is a network made of?
- #2 How is it shared?
- #3 How is it organized?
- #4 How does communication happen?
- #5 How do we characterize it?

No exercise session

this Thursday

Next Monday on

Communication Networks

Routing concepts
